

Rishta & Rang

20 din mein V1

Poora code parh kar client ki roadmap ke khilaf check kiya gaya. Neeche: kya ban chuka hai, kya baqi hai, aur roz kya kaam karna hai taake 20 din mein app launch ho sake.

7

V1 FEATURES
POORI

3

V1 AADHI

4

V1 MISSING

9

V2 FEATURES
ALREADY SHURU

KHULASA

Project abhi kahan khara hai

Sach ye hai ke **UI ka kaam V1 se kaafi aage nikal chuka hai**. 24 screens, 33 components, 12,344 lines TypeScript, teen zabanein, light aur dark theme — aur V2 ki 9 features ki screens bhi pehle se bani hui hain (CNIC verification, Wali dashboard, voice notes, call screen, privacy controls, compatibility score).

Masla doosri taraf hai: **app ka data ek hi user ke andar band hai**. Firestore mein har cheez `users/{uid}/` ke neeche owner-only hai, is liye do users ke darmiyan kuch bhi nahi ho sakta — na chat pohanchti hai, na like ka pata chalta hai, na Move to Rishta ki request jaati hai. Jo cheezein screen par kaam karti nazar aati hain, wo andar se `setTimeout` aur random data se banayi gayi hain.

Doosra bara masla: **photos kahin upload hi nahi hotin**. Local file: `// path` database mein save hota hai, is liye har user doosron ki profile blank dekhega.

Achhi khabar: dono maslon ka hal client-side hai. Poori V1 ke liye Node/Express backend ki zaroorat nahi — sirf Firestore ka schema, security rules, aur listeners ka kaam hai.

CLIENT KI REQUIREMENTS

V1 ki 14 features — ek ek ka status

✓ Ho chuka ½ Aadha — UI hai, andar ka kaam baqi ✗ Missing ya nakli

UNIVERSAL FEATURES

#	FEATURE	STATUS	CODE MEIN ASAL HAQEEQAT
1	Onboarding & Intent Setting	✓	Teen intent, 2–4 photos, bio — bilkul spec ke mutabiq. <code>IntentPhotosScreen.tsx</code>
2	Photo Upload & Selfie Verification	½	Photo upload hi nahi hoti — <code>mediaUpload.ts</code> poora placeholder hai. Selfie check sirf <code>Boolean(selfieUri)</code> hai, chehra dekha hi nahi jaata
3	Urdu + English UI	✓	Spec se aage — teen zabanein, Urdu RTL layout ke saath
4	In-App Text Messaging	✗	Message sirf apni collection mein jaata hai, doosre user tak nahi. Emoji reactions bilkul nahi. Roadmap ka “core loop” band hai
5	Block & Report	½	Block asli hai. Report nakli — <code>onSubmitReport(_reason)</code> reason discard kar ke sirf toast dikhata hai
6	Basic Match Suggestions (filters)	✗	Sirf gender filter. <code>FilterSheet.tsx</code> bana hua hai magar poore project mein kahin import hi nahi hota

DATING MODE

#	FEATURE	STATUS	CODE MEIN ASAL HAQEEQAT
7	Swipe Discovery	✓	Chal raha hai, animations aur daily like limit ke saath
8	Vibe Tags	✓	Profile par dikhte hain, database mein save hote hain
9	‘Move to Rishta’ Button	½	UI poori hai, magar <code>MatchesContext.tsx:201</code> par <code>setTimeout</code> khud hi “accepted” likh deta hai. Ye app ka signature idea hai — abhi test hi nahi ho sakta

RISHTA MODE

#	FEATURE	STATUS	CODE MEIN ASAL HAQEEQAT
10	Basic Matrimonial Profile	✓	Religion, sect, family background, education — chaaron hain. Spec se aage bhi
11	Rishta Readiness Signal	✓	Teenon options, profile card par visible
12	Manual Filters (age, sect, city, readiness)	✗	Bilkul nahi hai. Sab ko sab kuch dikhta hai

MONETIZATION

#	FEATURE	STATUS	CODE MEIN ASAL HAQEEQAT
13	Free Tier — limited daily likes	✓	15 likes/din, Firestore mein per-user save, agle din reset
14	Single Paid Unlock (Explore+ lite)	✗	Koi payment nahi — Upgrade dabao aur muft pro. “Who liked you” bhi nakli: deck se 4 random profiles dikhata hai

ROADMAP SE BAHAR

4 cheezein jo requirements mein nahi, magar launch ke liye lazmi hain

CHEEZ	STATUS	KYUN ZAROORI HAI
Forgot / Reset Password	✗	Bilkul nahi hai. Password bhoolne wala user hamesha ke liye locked out ho jaayega — ye har app ki basic zaroorat hai
Privacy Policy & Terms ka asli matn	½	Legal screen bani hui hai. Play Store aur App Store dono bina privacy policy URL ke app reject kar dete hain — khaas kar dating category mein
Firestore composite indexes	✗	<code>firestore.indexes.json</code> khali hai. Filters ke saath queries bina index ke chalengi hi nahi
Tests ya lint	✗	Koi test aur koi lint config nahi. V1 ke liye optional hai, lekin 20 din mein manual testing ka waqt rakhna parega

BONUS

V2 ki jo features pehle se shuru ho chuki hain

Ye client ko batane wali baat hai: team ne V1 ke scope se aage ja kar V2 ki kaafi screens bana di hain. Zyada tar ka UI mukammal hai — bas server-side hissa baqi hai.

V2 FEATURE	STATUS	KITNA BAN CHUKA
Extended Matrimonial Profile		Prayer habits, income range, living abroad — sab schema mein maujood aur kaam kar rahe hain
CNIC / ID Verification		Kaafi mazboot: format validation, CNIC ke aakhri digit se gender check, aur photo ka on-device card analysis. Baqi: photo upload aur admin review
Voice Notes		Record aur send kaam karta hai, magar one-sided chat aur upload ke masle wahi hain
Privacy Controls		Teen toggles chal rahe hain (profile visible, online status, blur photos). Incognito aur screenshot lock baqi
Notification Controls		Paanch toggles Firestore mein save hote hain — magar abhi push notifications hain hi nahi, sirf in-app
AI Compatibility Score		Score card par dikhta hai, magar wo rule-based hai (age, city, tags) — 15-question assessment nahi
Wali Dashboard		Wali ka naam aur contact save hota hai. Koi invite waqai bheja nahi jaata, na chat summary hai, na milestones
Photo Privacy Tiers		Teen mein se ek tier: blur photos toggle
Video / Voice Calls		Call screen sirf apna camera aur timer dikhati hai. Koi WebRTC/Agora nahi — ye abhi mockup hai

Node/Express banani hai ya nahi

JAWAB

V1 ke liye nahi. Ek bhi baqi feature ke liye nahi.

Chat, filters, report, photos, likes, Move to Rishta — sab Firestore ke schema, security rules aur onSnapshot se ho jaate hain. Sirf payment ko server chahiye, aur wo server RevenueCat ka hai, aapka nahi.

Payment ki tafseel: Google Play aur Apple digital goods ke liye apna in-app purchase lazmi karte hain — JazzCash ya Easypaisa app ke andar lagayenge to app reject ho jaayegi. IAP ki receipt verify karna server ka kaam hai, warna banda jhooti receipt bana kar muft pro ban jaayega. RevenueCat exactly yehi apne server par karta hai; aap sirf unki library lagate ho.

Backend V2 mein chahiye hoga — asli AI compatibility scoring, content moderation, fake profile detection, aur push notifications bhejna. Aur tab bhi Express nahi, **Cloud Functions**, kyunki wo usi Firebase project mein chalti hain.

20 din ka plan

Har din ka kaam tick kar sakte hain — progress isi browser mein mehfooz rehti hai. Tarteef roadmap ki logic se hai: pehle woh cheezein jinke baghair V1 apna sawal hi nahi pooch sakti, phir safety, phir monetization, phir launch.

Hafta 1 — Data layer Din 1-5

Sab se bara aur sab se zaroori hissa. Iske baghair baqi sab kuch nakli rehta hai.

DIN 1 Photos ka asli upload

- ☐ Firebase Console mein Blaze plan on karo aur \$5 ka budget alert laga do
- ☐ Cloud Storage enable karo, phir `npx firebase deploy --only storage` — rules pehle se likhi hui hain
- ☐ `mediaUpload.ts` ki chhe placeholder functions asli upload se replace karo
- ☐ Purani profiles ke `file://` photo paths database se saaf karo
- ☐ Do device se test: ek phone se photo lagao, doosre par dikhni chahiye

DIN KE AAKHIR TAK — har user doosron ki asli photos dekh sakta hai.

DIN 2 Naya database schema + rules

- ☐ Naye shared collections design karo: `likes/{from}_{to}`, `matches/{id}` with `members[]`, `matches/{id}/messages`, `reports/{id}`
- ☐ `firestore.rules` likho — match sirf tab bane jab `exists()` se mutual like confirm ho
- ☐ Rules deploy karo aur Firebase ke Rules Playground mein test karo
- ☐ Purana dev data wipe karo — `users/{uid}/matches` aur `/messages`
- ☐ `firestorePaths.ts` mein naye paths add karo

DIN KE AAKHIR TAK — database do users ke darmiyan baat karne ke qabil ho gaya.

DIN 3

Chat ka service layer

- ☐ `matchesService.ts` ko naye shared collection par likho
- ☐ `senderId` field add karo — `fromMe` ki jagah, jo ab kaam nahi karega
- ☐ `MatchesContext.tsx` ko naye service ke mutabiq update karo
- ☐ Unread count aur last message shared match doc mein rakho

DIN KE AAKHIR TAK — A ka bheja message B ke database mein pohanchta hai.

DIN 4

Real-time chat

- ☐ `getDocs` ki jagah `onSnapshot` lagao — messages aur matches dono par
- ☐ Screen band hote hi listener unsubscribe karo, warna memory leak hogi
- ☐ `cache.ts` ko naye shape ke mutabiq theek karo
- ☐ Do device se test: message turant doosri screen par aana chahiye

DIN KE AAKHIR TAK — asli live chat. Roadmap ka core loop chalu.

DIN 5

Asli likes, asli match, asli Move to Rishta

- ☐ Like par `likes/` mein doc likho, aur check karo ke unhon ne aapko like kiya ya nahi
- ☐ Mutual like par hi match banao — `HomeScreen.tsx` ka nakli celebration hatao
- ☐ `MatchesContext.tsx:201` ka `setTimeout` hatao — asli request/accept flow banao
- ☐ Move to Rishta ke liye accept/decline ke buttons doosre user ki chat mein dikhao

DIN KE AAKHIR TAK — app ka signature idea waqai test ho sakta hai.

Hafta 2 — V1 पूरी karo Din 6-10

Baqi missing features aur safety ka minimum bar.

DIN 6 Report ko asli karo

- ☐ `reports/` collection — rules mein sirf create allow, read kisi ko nahi
- ☐ `reportService.ts` banao aur dono `onSubmitReport` handlers wire karo
- ☐ Report ke saath auto-block ka option do
- ☐ Firebase Console mein reports parhne ka tareeqa likh kar rakho
- ☐ Forgot password flow — `sendPasswordResetEmail` aur Login screen par link

DIN KE AAKHIR TAK — safety ka minimum bar poora, aur locked-out users ka masla hal.

DIN 7 Dating filters

- ☐ `FilterSheet.tsx` ko HomeScreen mein lagao — component pehle se bana hua hai
- ☐ Age range, city aur intent ke filter controls banao
- ☐ Filter state `DiscoveryContext` mein rakho aur `AsyncStorage` mein yaad rakho
- ☐ `discoveryService.ts` ki query mein filters lagao

DIN KE AAKHIR TAK — Basic Match Suggestions ka requirement poora.

DIN 8 Rishta filters + indexes

- ☐ Rishta browse ke filters: age, sect, city, readiness
- ☐ `firestore.indexes.json` mein composite indexes likho — abhi khali hai
- ☐ `npx firebase deploy --only firestore:indexes` — build hone mein waqt lagta hai
- ☐ Har filter combination test karo, index ki errors console mein dekho

DIN KE AAKHIR TAK — dono modes mein filters chal rahe hain.

DIN 9 Who liked you + gating

- ☐ `ExplorePlusScreen.tsx:54` ke random admirers hatao — asli `likes/` se parho
- ☐ Free users ko blurred count dikhao, paid ko poori list
- ☐ Unlimited likes ka gating check karo — sirf paid users ke liye
- ☐ Har jagah dekho ke `isExplorePlus` theek se gate kar raha hai

DIN KE AAKHIR TAK — paywall ke peeche waqai kuch asli hai.

DIN 10

Emoji reactions + safai

- ☐ Message par long-press se emoji reaction — roadmap ka V1 requirement
- ☐ Reaction message doc mein save karo, dono users ko dikhe
- ☐ Explore tab ka faisla karo: `mockEvents` ki jagah asli collection, ya V1 se tab hi hata do
- ☐ Discovery ka demo deck fallback hatao — iski jagah asli empty state banao

DIN KE AAKHIR TAK — app mein koi nakli data nahi bacha.

Hafta 3 — Paisa aur polish Din 11-15

Payment chalu karo aur app ko store ke qabil banao.

DIN 11

Store setup + RevenueCat

- ☐ Play Console aur App Store Connect par Explore+ ke products banao
- ☐ RevenueCat account banao aur dono stores connect karo
- ☐ `react-native-purchases` install karo — latest Expo docs dekh kar
- ☐ EAS development build banao — IAP Expo Go mein nahi chalti

NOTE — store products approve hone mein waqt lag sakta hai, is liye ye kaam pehle shuru karna behtar hai.

DIN 12

Paywall chalu karo

- ☐ `ExplorePlusScreen.tsx:71` ka muft toggle hatao — asli purchase call lagao
- ☐ `isExplorePlus` RevenueCat ke entitlement se set karo, apni marzi se nahi
- ☐ Restore purchases ka button — Apple ki taraf se lazmi hai
- ☐ Sandbox account se poora purchase flow test karo

DIN KE AAKHIR TAK — V1 ka asal sawal (log paisay dete hain ya nahi) test ho sakta hai.

DIN 13**Verification पूरी करो**

- ☐ Selfie aur CNIC photos ab asli storage par upload karo (`verification/` path)
- ☐ Profile par `verificationStatus` field: pending / approved / rejected
- ☐ Approved profiles par verified badge dikhao
- ☐ Console se manual review ka apna tareeqa likh kar rakho — V1 ke liye automated nahi chahiye

DIN KE AAKHIR TAK — verification ka trust badge asli hai, sirf dikhawa nahi.

DIN 14**Legal aur store listing**

- ☐ Privacy Policy aur Terms likho aur kisi public URL par host karo — store ke liye lazmi
- ☐ Legal screen mein asli matn dalo
- ☐ Play Store ka Data Safety form bharo — batao ke kaun sa data jama hota hai
- ☐ App ka description, screenshots aur feature graphic tayyar karo
- ☐ Content rating questionnaire — dating apps ke liye alag qawaid hain

DIN KE AAKHIR TAK — store submission ke kaghazaat tayyar.

DIN 15**Error handling aur edge cases**

- ☐ Har screen ka empty state check karo — koi match nahi, koi message nahi, deck khatam
- ☐ Network band ho to kya hota hai — har screen par test karo
- ☐ Firestore permission-denied errors user ko theek se dikhao
- ☐ Account delete ko naye shared collections ke saath dobara check karo
- ☐ Blocked user ka data har jagah se ghayab hona chahiye — chat, deck, likes

DIN KE AAKHIR TAK — app ajeeb halaat mein bhi tootti nahi.

Hafta 4 — Test aur launch Din 16-20

Asli devices par asli testing, phir store par.

DIN 16

Do devices se poora end-to-end test

- ☐ Do asli accounts banao — ek mard, ek aurat
- ☐ Poora safar test karo: signup → photos → selfie → deck → like → match → chat → Move to Rishta
- ☐ Block, report, unmatched, account delete — sab test karo
- ☐ Teenon zabanein test karo, khaas kar Urdu ka RTL layout
- ☐ Light aur dark theme dono mein har screen dekho

DIN KE AAKHIR TAK — har bug ki likhi hui list.

DIN 17

Bugs fix — pehla round

- ☐ Har wo bug theek karo jo user ko rok deta hai
- ☐ Chhoti UI ki galtiyen aur ghalat translations theek karo
- ☐ Chhote phone par layout check karo — ek 5-inch device par

DIN KE AAKHIR TAK — koi blocking bug nahi bacha.

DIN 18

Preview build + doston se testing

- ☐ `eas build --profile preview --platform android` — APK banao
- ☐ 8–10 logon ko APK bhejo aur unka feedback lo
- ☐ Dekho ke asli log kahan atakte hain — khaas kar signup mein
- ☐ Firebase Console mein reads/writes ka kharcha dekho

DIN KE AAKHIR TAK — asli logon ka feedback haath mein.

DIN 19

Feedback ke fixes + production build

- ☐ Testers ne jo cheezein batayin, unhein theek karo
- ☐ Production rules dobara parho — koi test wala loophole na reh jaaye
- ☐ `eas build --profile production` dono platforms ke liye
- ☐ App icon, splash screen aur version numbers check karo

DIN KE AAKHIR TAK — store par bhejne wali build tayyar.

- ☐ Play Console par closed testing track mein upload karo
- ☐ App Store Connect par TestFlight ke liye bhejo
- ☐ Firebase Analytics ya Crashlytics laga do — taake pata chale ke log kya kar rahe hain
- ☐ V1 ke sawalon ke jawab naapne ka tareeqa tay karo: kitne signup, kitne match, kitne 'Move to Rishta', kitne paid

DIN KE AAKHIR TAK — V1 testers ke haath mein.

Ek risk pehle se jaan lein. Naye personal Play Console accounts ke liye Google ki sharat hai ke app ko production mein jaane se pehle 12 testers ke saath 14 din closed testing mein rehna parta hai. Agar aapka account naya hai, to **20 din mein app testers tak pohanch jaayegi, magar public launch us se 2 hafte aage jaayega.**

Iska hal: Din 1 hi se Play Console account aur testers ka intezaam shuru kar dein, taake closed testing ka clock saath saath chalta rahe.

Plan tang hai, magar mumkin hai — is shart par ke poore din kaam ho aur Hafta 1 apne waqt par khatam ho. Agar 20 din se aage nahi ja sakte, to sab se pehle Explore tab (Din 10) aur verification badge (Din 13) girayein — ye V1 ke asal sawal ka hissa nahi hain.

Jo cheez kabhi na girayein: **Hafta 1 ka koi bhi din.** Unke baghair app apna hypothesis test hi nahi kar sakti.

AAKHRI TABLE

Sab kuch ek nazar mein

 Ho chuka  Aadha  Missing
